BUG-UI-001: Missing client-side validation and silent UI failure for negative dependents (Add & Edit Employee)

• **Severity:** Medium

• **Description:** Both the "Add Employee" and "Update Employee" modals allow users to input negative numbers into the Dependents field. When submitted, the backend API correctly rejects the request with a 400 Bad Request, but the UI fails silently and does not display any visual error message or feedback to the user.

• **Steps to Reproduce:**

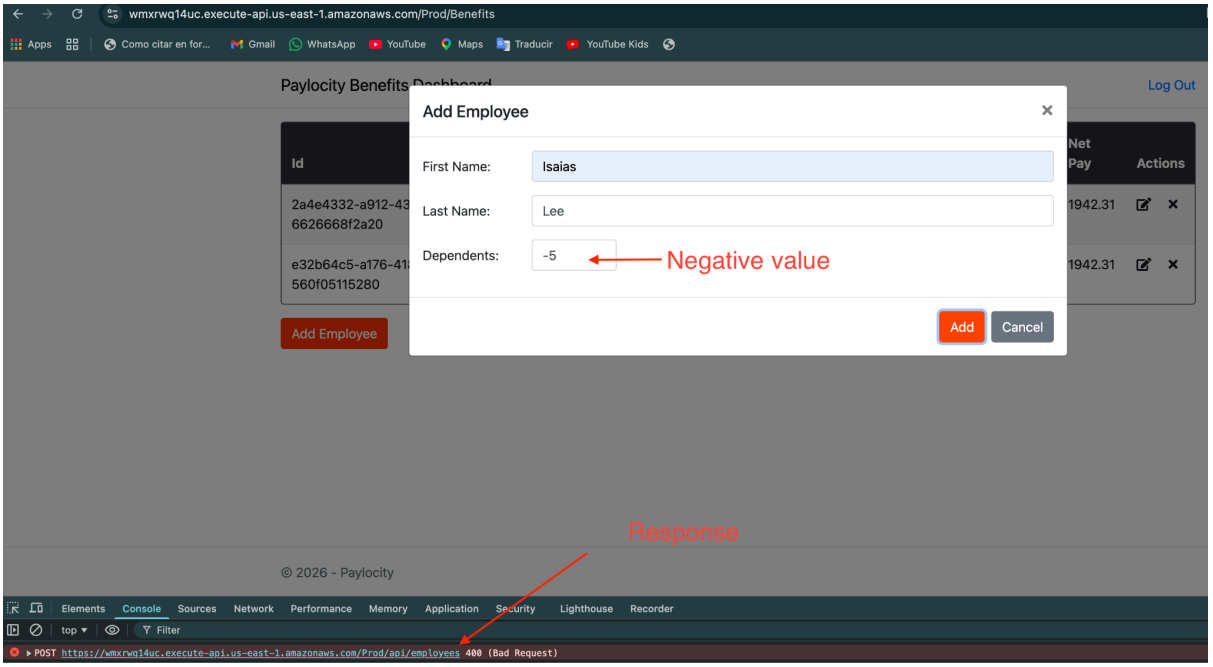
1. Log in to the application and navigate to the Benefits Dashboard.
2. Click the "Add Employee" button (or click the Edit pencil icon on an existing employee).
3. Enter a negative integer in the Dependents field (e.g., "-5").
4. Click the "Add" (or "Save") button.

• **Expected Result:** 1. The UI form should prevent the user from typing negative numbers. If an invalid request is sent, the UI should gracefully handle the 400 Bad Request API response and display a clear validation error to the user (e.g., "Dependents cannot be less than 0").

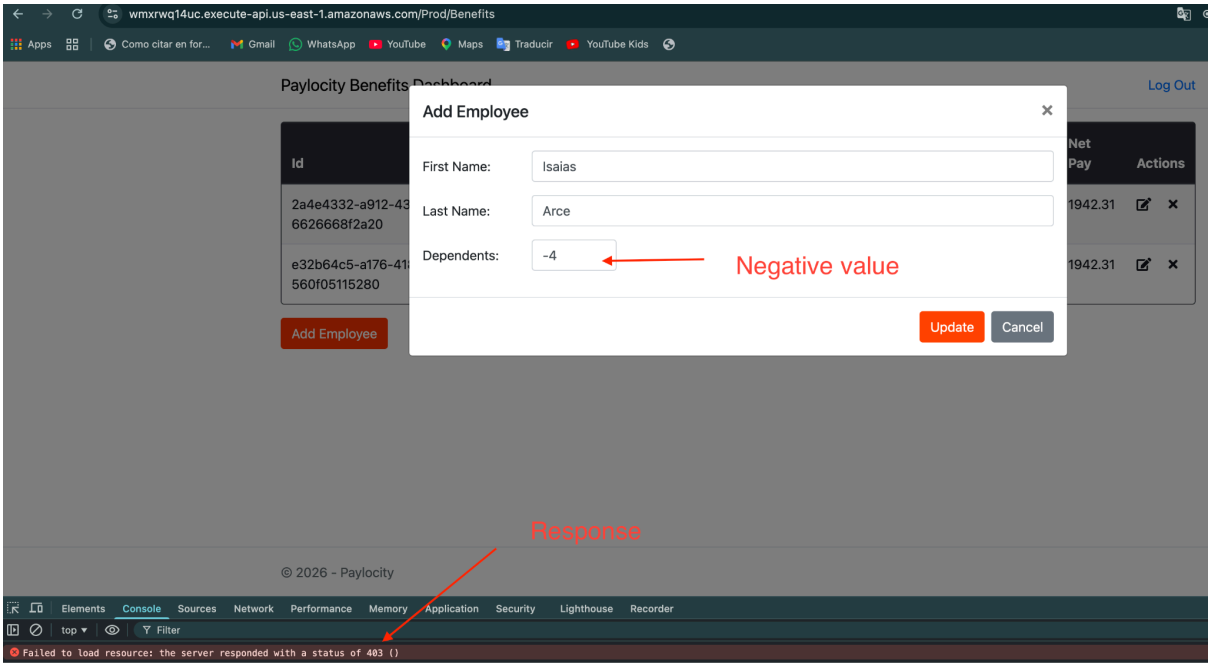
• **Actual Result:** The application fails silently in both Add and Edit modes. The user receives no visual feedback, the modal remains open, and the browser console logs multiple POST/PUT 400 (Bad Request) errors.

Evidence:

For Adding an employee



For updating an employee



BUG-UI-002: Incorrect modal title displayed when editing an existing employee

• **Severity:** Low

• **Description:** When a user clicks the edit action for an existing employee, the modal that opens incorrectly displays the title "Add Employee". While the submission button correctly says "Update", the title remains static, which could cause user confusion regarding the action they are performing.

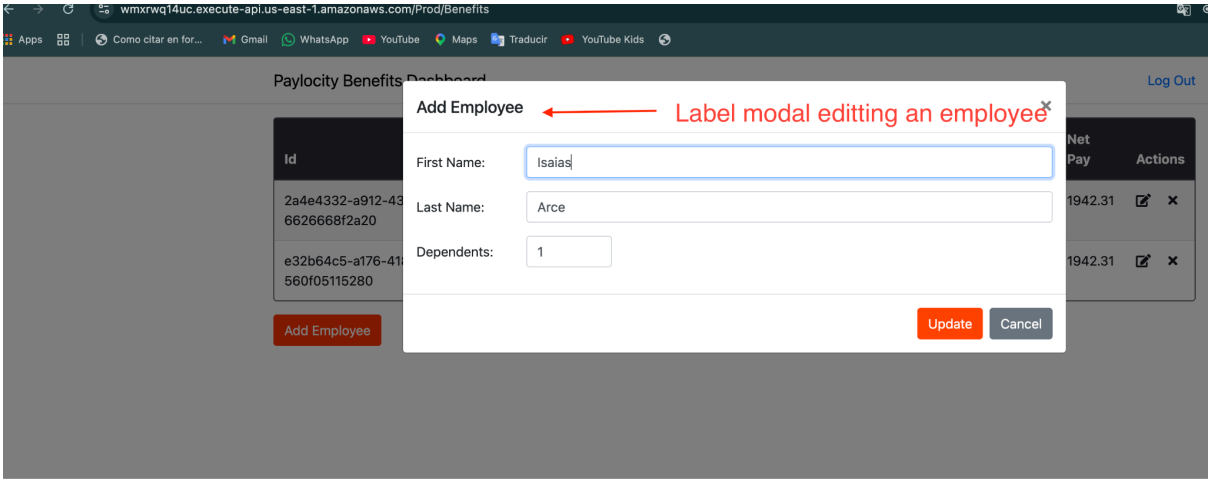
• **Steps to Reproduce:**

1. Log in to the application and navigate to the Benefits Dashboard.
2. Ensure there is at least one existing employee in the table.
3. Click the "Edit" icon (pencil) in the Actions column for that employee.
4. Observe the title text at the top left of the opened modal.

• **Expected Result:** The modal title should be dynamically updated to reflect the user's current context (e.g., "Edit Employee" or "Update Employee").

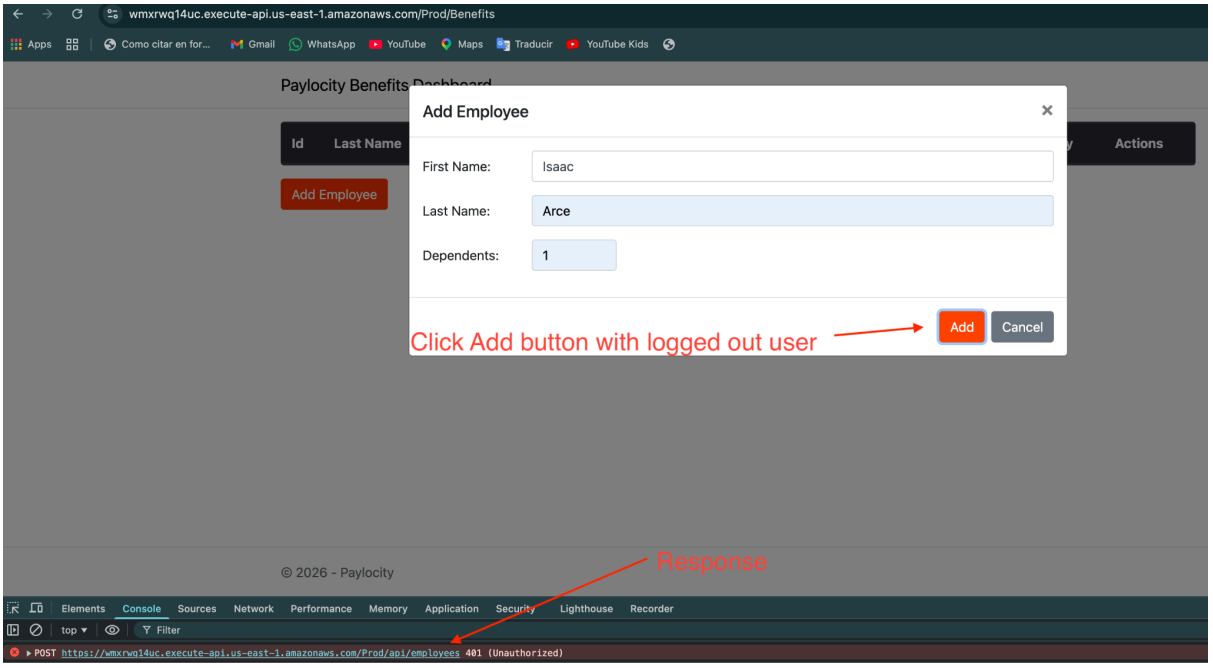
• **Actual Result:** The modal title displays "Add Employee".

Evidence:



BUG-UI-003: Silent UI failure and missing redirect on session expiration (401 Unauthorized)
• **Severity:** High
• **Description:** When a user's session expires (or the auth token is otherwise invalidated) and they attempt to submit data, the API correctly blocks the request and returns a 401 Unauthorized status. However, the UI does not intercept this error. It fails to notify the user that their session has expired and does not redirect them back to the login screen, leaving them stuck on an unresponsive form.
• **Steps to Reproduce:**
1. Log in to the application and navigate to the Benefits Dashboard.
2. Invalidate the session (e.g., by logging out in a duplicate tab, clearing the browser's session storage/cookies, or waiting for the token to naturally expire).
3. On the original dashboard tab, click "Add Employee" to open the modal.
4. Fill in valid employee details and click "Add".

• Expected Result: The frontend client should globally intercept the 401 Unauthorized response, display a message indicating the session has expired, and automatically route the user back to the /Account/Login page.
• **Actual Result:** The UI fails silently. The user receives no visual feedback, the modal remains open, and the browser console logs a POST 401 (Unauthorized) error.



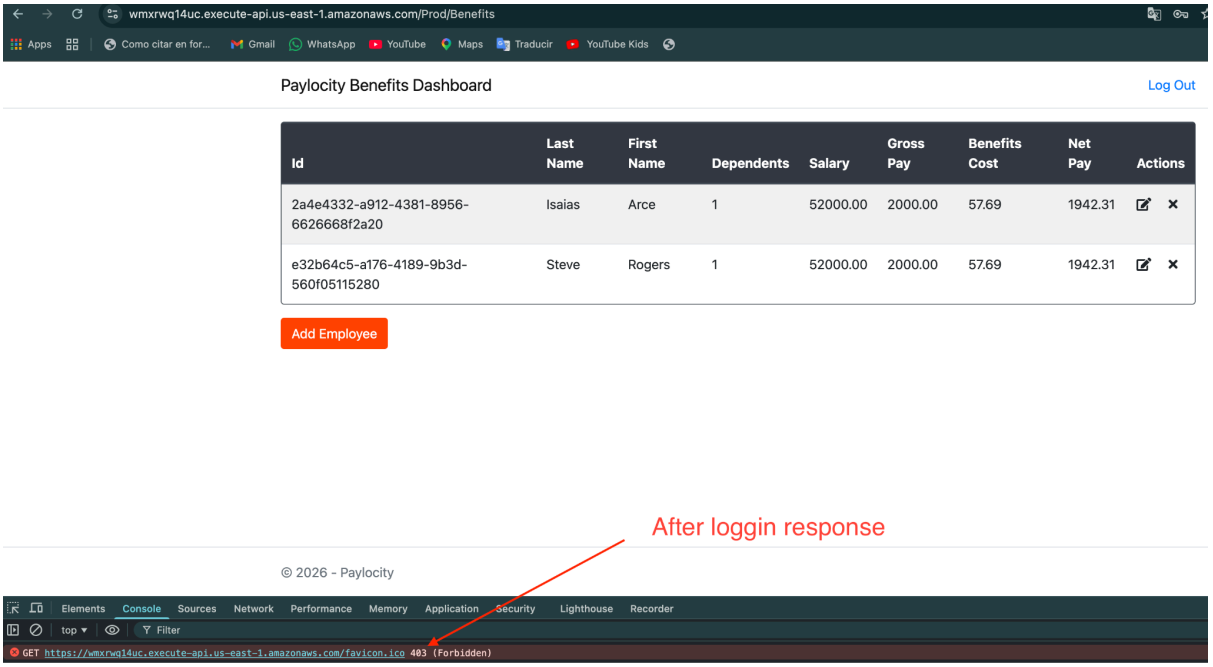
BUG-UI-004: Missing favicon results in 403 Forbidden console error
• **Severity:** Low
• **Description:** When the Benefits Dashboard loads, the browser automatically attempts to fetch the site's favicon (/favicon.ico). The server is not configured to serve this static asset and rejects the request with a 403 Forbidden error, resulting in unnecessary console noise.
• **Steps to Reproduce:**
1. Log in to the application and navigate to the Benefits Dashboard.
2. Open the browser's Developer Tools and navigate to the Console tab.

3. Refresh the page.
4. Observe the network request errors in the console.

• **Expected Result:** The application should be configured to serve a valid favicon.ico asset resulting in a 200 OK response, preventing any console errors on page load.

• **Actual Result:** A GET request to .../favicon.ico fails with a 403 Forbidden error logged in the browser console.

Evidence:



BUG-UI-005: Missing tooltips and descriptive labels for action icons

• **Severity:** Low

• **Description:** The "Edit" (pencil) and "Delete" (X) icons in the employee data table do not display any descriptive text or tooltips when hovered over with the mouse cursor. This forces users to rely solely on visual iconography to guess the button's function and negatively impacts accessibility.

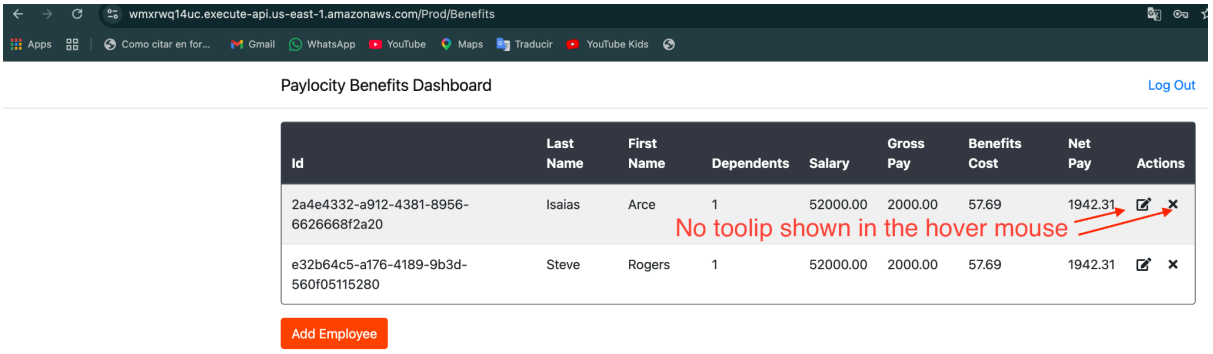
• **Steps to Reproduce:**

1. Log in to the application and navigate to the Benefits Dashboard.
2. Ensure there is at least one employee record visible in the table.
3. Hover the mouse cursor over the pencil icon in the Actions column.
4. Hover the mouse cursor over the 'X' icon in the Actions column.

• **Expected Result:** A descriptive tooltip (e.g., "Edit Employee" and "Delete Employee") should appear on hover. Additionally, the HTML elements should contain proper aria-labels for screen reader accessibility.

• **Actual Result:** No tooltips or descriptive text appear when hovering over the action buttons.

• **Evidence:**



BUG-UI-006: Missing password recovery option on the login screen

• **Severity: High**

• **Description:** The login page does not provide a "Forgot Password" or password recovery mechanism. If a user forgets their credentials, they have no self-service way to regain access to their account, potentially resulting in a permanent lockout and requiring manual administrative intervention.

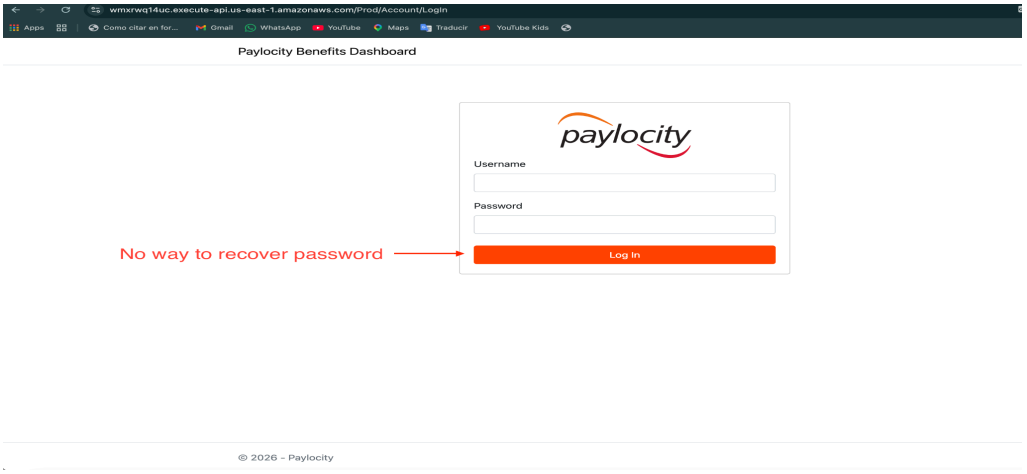
• **Steps to Reproduce:**

1. Navigate to the application's login page (/Account/Login).
2. Observe the available input fields and actions below the Username and **Password fields.**

• **Expected Result:** There should be a "Forgot Password?" or "Reset Password" link available near the login form to trigger a secure password recovery flow via email.

• **Actual Result:** The login screen only contains the Username field, Password field, and "Log In" button. No password recovery option exists.

Evidence:



BUG-UI-007: Application crashes with HTTP 405 error on invalid login attempt

• **Severity:** High

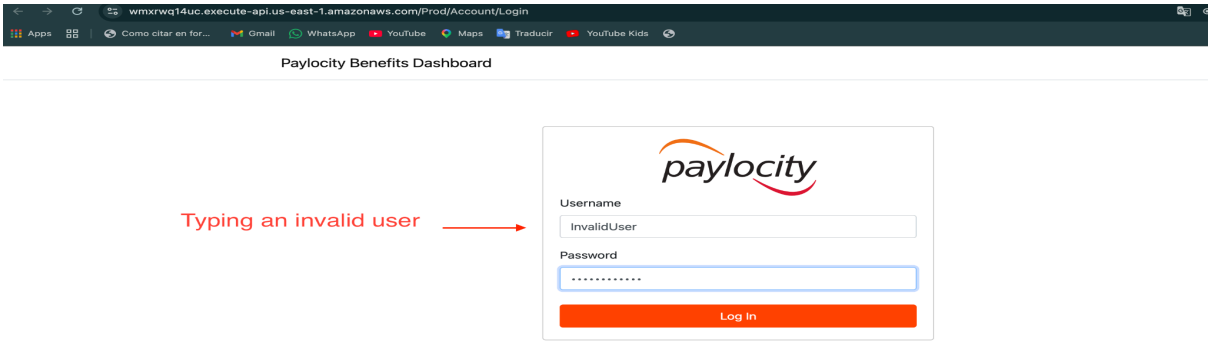
• **Description:** When a user attempts to log in using invalid username, the system fails to handle the authentication rejection gracefully. Instead of remaining on the login page and displaying an "The specific username or password is incorrect" validation message, the application redirects to a broken page displaying a raw browser HTTP ERROR 405. The console confirms the POST request to /Account/Login fails with a 405 (Method Not Allowed) status.

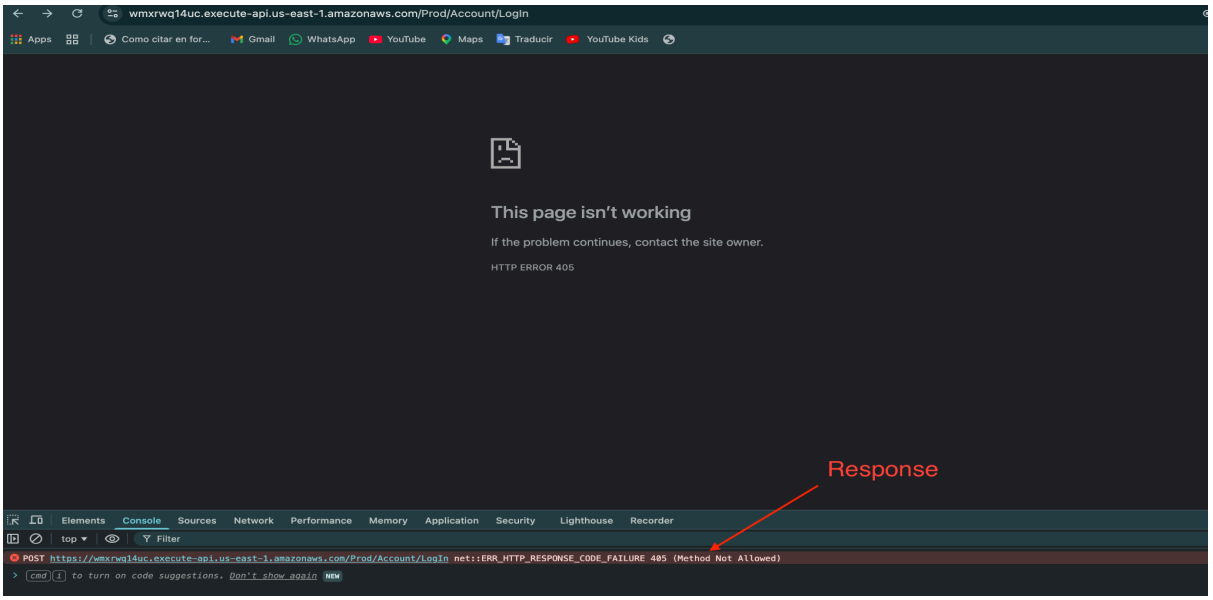
• **Steps to Reproduce:**

1. Navigate to the application's login page (/Account/Login).
2. Enter an invalid username.
3. Click the "Log In" button.

• **Expected Result:** The application should catch the failed authentication, remain on the /Account/Login page, and display “The specific username or password is incorrect.”.

• **Actual Result:** The UI completely breaks, redirecting the user to a blank error page that displays "This page isn't working - HTTP ERROR 405".

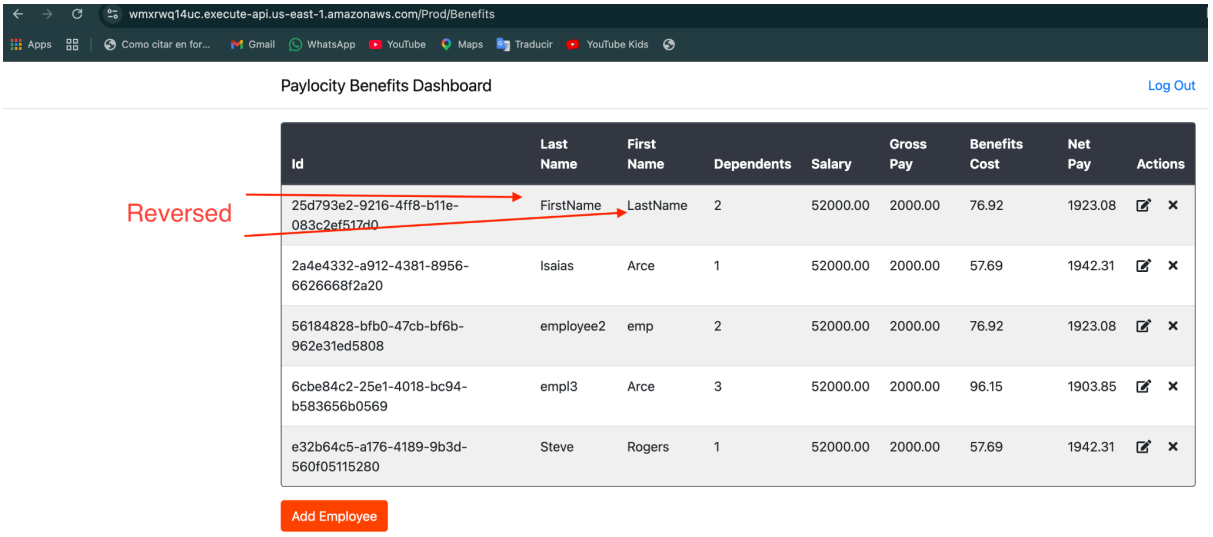




BUG-UI-008: First Name and Last Name data are reversed in the data table
• **Severity:** Medium (Data Presentation)
• **Description:** There is a data mapping error in the Benefits Dashboard data table. The values for an employee's first and last names are rendered under the incorrect column headers. The employee's firstName is displayed in the "Last Name" column, and their lastName is displayed in the "First Name" column.
• **Steps to Reproduce:**
1. Log in to the application and navigate to the Benefits Dashboard.
2. Click "Add Employee".
3. Enter a distinctly recognizable First Name (e.g., "Steve") and Last Name (e.g., "Rogers").
4. Click the Add/Save button.
5. Locate the newly created employee in the data table.

• **Expected Result:** The "First Name" column should display the first name (e.g"Steve"), and the "Last Name" column should display the last name (e.g "Rogers").
• **Actual Result:** The data is swapped. The "Last Name" column displays "Steve", and the "First Name" column displays "Rogers".

• **Evidence:**



Id	Last Name	First Name	Dependents	Salary	Gross Pay	Benefits Cost	Net Pay	Actions
25d793e2-9216-4ff8-b11e-083c2ef517d0	FirstName	LastName	2	52000.00	2000.00	76.92	1923.08

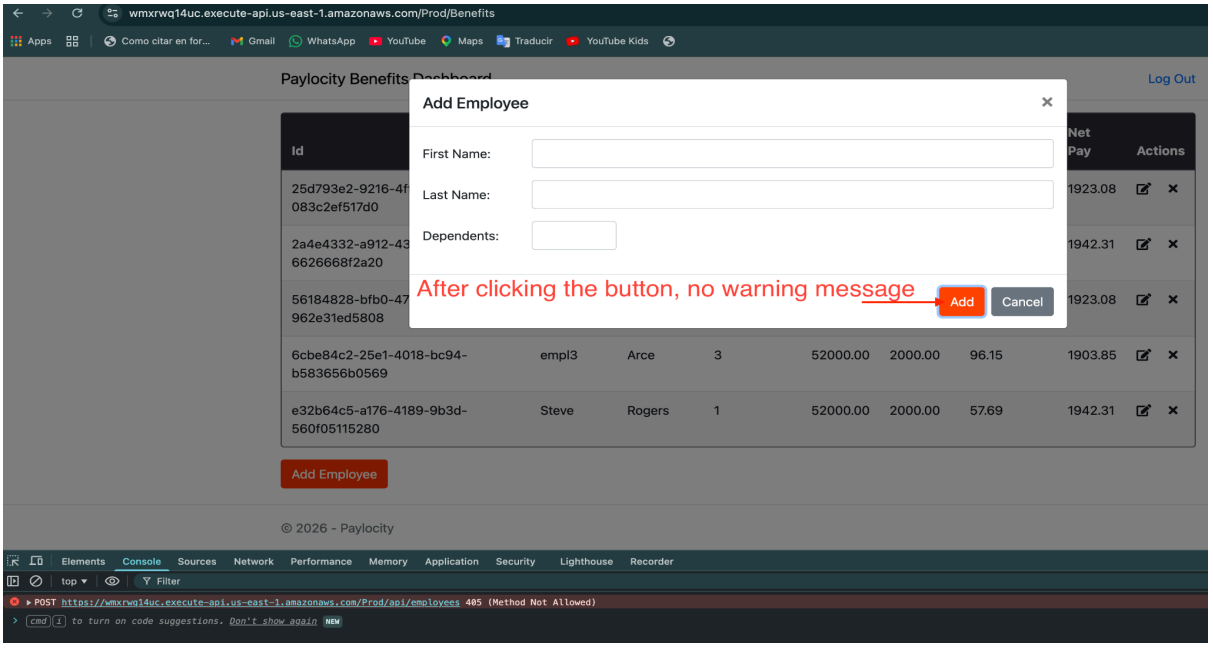
BUG-UI-009: Missing client-side validation for empty mandatory fields
• **Severity:** Medium
• **Description:** The "Add Employee" modal does not enforce "required field" validation. If a user attempts to submit the form with empty values for First Name, Last Name, or Dependents, the UI does not display any warning or error messages to prompt the user. The application attempts to send the empty payload to the API, failing silently on the frontend while throwing an error in the background.
• **Steps to Reproduce:**

1. Log in to the application and navigate to the Benefits Dashboard.
2. Click the "Add Employee" button to open the modal.
3. Leave the First Name, Last Name, and Dependents fields completely blank.
4. Click the "Add" button.

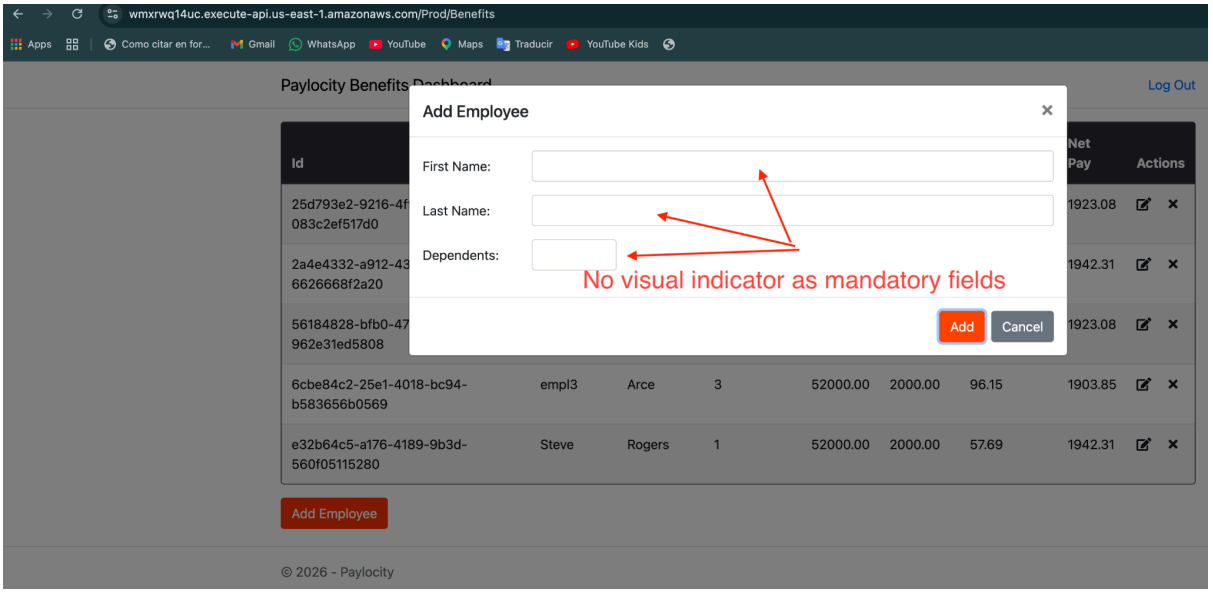
• **Expected Result:** The form submission should be blocked by the frontend, and clear validation messages (e.g., "First Name is required", "Dependents must be a number") should appear next to the respective fields.
• **Actual Result:** The UI fails silently and provides no visual feedback or error messages to the user. The modal remains open, and the browser console logs a failed POST request (405 Method Not Allowed).
• **Evidence:**



BUG-UI-010: Missing visual indicators for required form fields
• **Severity:** Low
• **Description:** The "Add Employee" and "Edit Employee" modals do not provide any visual cues (such as an asterisk * or the word "Required") next to the field labels to indicate which inputs are mandatory. This forces the user to guess whether a field can be left blank, leading to a poor user experience.
• **Steps to Reproduce:**
1. Log in to the application and navigate to the Benefits Dashboard.
2. Click the "Add Employee" button to open the modal.
3. Observe the labels for "First Name", "Last Name", and "Dependents".

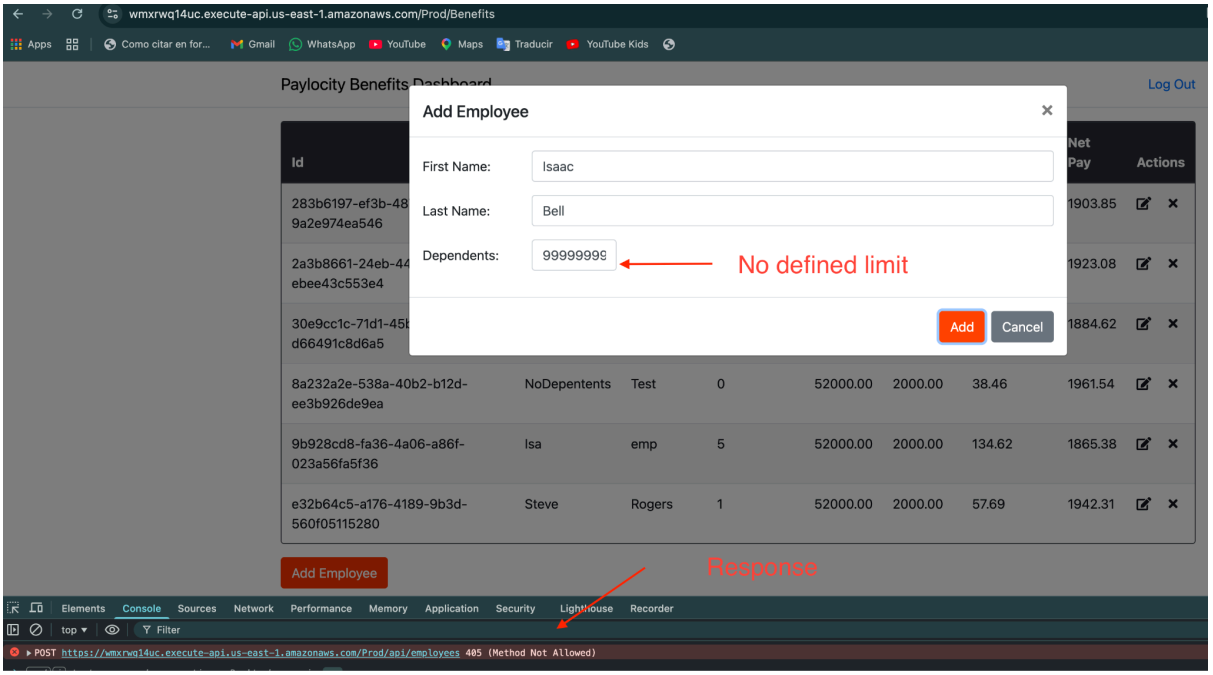
• **Expected Result:** Mandatory fields should be clearly marked with a visual indicator (e.g., First Name *) so users know they must be filled out prior to attempting submission.
• **Actual Result:** There are no visual indicators denoting required fields on the form.

• **Evidence:**



BUG-UI-011: Missing maximum value boundary limit on Dependents input field
• **Severity:** Medium
• **Description:** The "Dependents" input field lacks a maximum value constraint (e.g., max="99" or maxlength="2"). This allows users to enter unrealistically large integers (e.g., 99,999,999). Submitting these excessively large values causes a silent UI failure where the modal remains open without user feedback, and a 405 Method Not Allowed error is generated in the browser console.
• **Steps to Reproduce:**
1. Log in to the application and navigate to the Benefits Dashboard.
2. Click the "Add Employee" button to open the modal.
3. Enter a valid First Name and Last Name.
4. Enter an extremely large number into the Dependents field (e.g., 99999999).
5. Click the "Add" button.

• **Expected Result:** The UI should restrict the input to a realistic boundary (e.g., a maximum of 2 digits) using client-side validation, preventing the user from submitting the form and displaying a clear warning message.
• **Actual Result:** The field accepts the large number, the UI fails silently, and a 405 error is logged in the network console.
• **Evidence:**



BUG-UI-012: HTML/Script tags are silently stripped, resulting in empty data record**s**
* **Severity:** Medium
* **Description:** When a user inputs HTML or JavaScript tags into the text fields (e.g., attempting an XSS payload), the application's sanitizer silently strips the tags. Because there is no validation preventing empty submissions, this results in blank data being saved and displayed in the table without any warning or error message to the user.
* **Steps to Reproduce:**
1. Log in to the application and navigate to the Benefits Dashboard.
2. Click "Add Employee".
3. Enter <script>alert('test')</script> in the First Name field.
4. Enter "Sec" in the Last Name field and "1" for Dependents.
5. Click Add.
* **Expected Result:** The application should either safely encode the characters to display them as plain text, or reject the input with a validation error (e.g., "Special characters < > are not allowed").
* **Actual Result:** The tags are silently deleted, and the employee is saved with a completely blank name field.
* **Evidence:**

BUG-UI-013: Broken Access Control allows unauthenticated access to the Benefits Dashboard

• **Severity:** High

• **Description:** The frontend application fails to implement proper route guarding. A user who is not logged in (and holds no valid session token) can manually navigate directly to the /Prod/Benefits URL and view the secure dashboard interface.

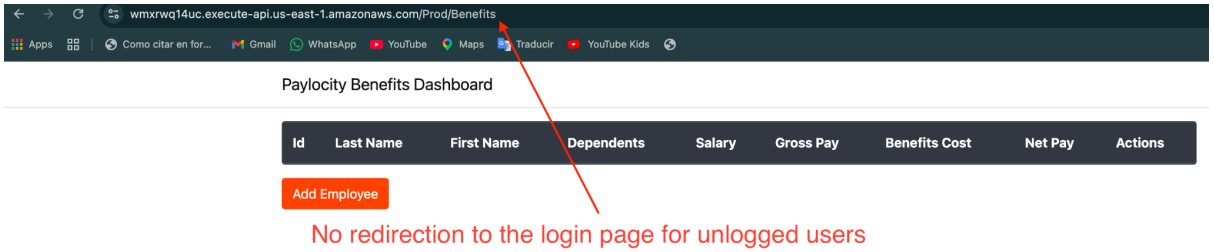
• **Steps to Reproduce:**

1. Ensure you are completely logged out of the application (or open an Incognito/Private browsing window).
2. Click on “Paylocity Benefits Dashboard”or paste the direct URL to the dashboard: https://wmxrwq14uc.execute-api.us-east-1.amazonaws.com/Prod/Benefits into the address bar.
3. Press Enter.

• **Expected Result:** The application should detect the lack of an active, valid session and immediately redirect the user to the /Account/Login page before rendering any dashboard components.

• **Actual Result:** The application allows the unauthenticated user to access the /Prod/Benefits route and renders the dashboard UI.

• **Evidence:**



BUG-UI-014: Missing character length limits and unhandled 400 Bad Request errors

• **Severity:** Medium

• **Description:** The First Name and Last Name input fields do not restrict the maximum number of characters a user can type (e.g., missing maxlength attribute). When a user submits a string that exceeds the database's limit, the API correctly rejects the request with a 400 Bad Request. However, the UI fails to catch this error, leaving the modal open and providing no warning message or visual feedback to the user.

• **Steps to Reproduce:**

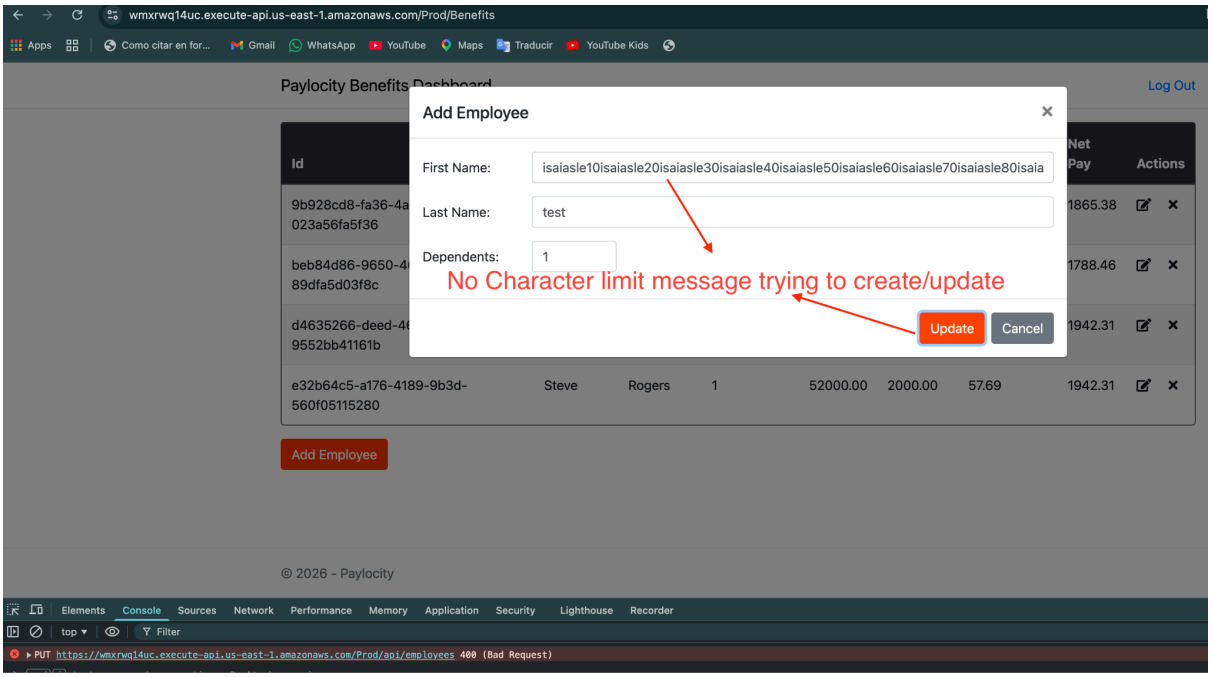
1. Log in to the application and navigate to the Benefits Dashboard.

2. Click the Edit (pencil) icon for an existing employee.
3. Enter an excessively long string (e.g., 100+ characters) into the First Name or Last Name field.
4. Click the "Update" button.

• **Expected Result:** The input field should restrict typing past a certain character limit. If a validation error occurs on the backend, the UI should intercept the 400 Bad Request and display a user-friendly error message (e.g., "First Name is too long").

• **Actual Result:** The UI allows the long input and fails silently upon submission. The modal remains open, no error message is displayed, and the browser console logs a PUT 400 (Bad Request) network error.

• **Evidence:**



BUG-UI-015: Dependents field accepts special characters and silently alters data

• **Severity:** Low

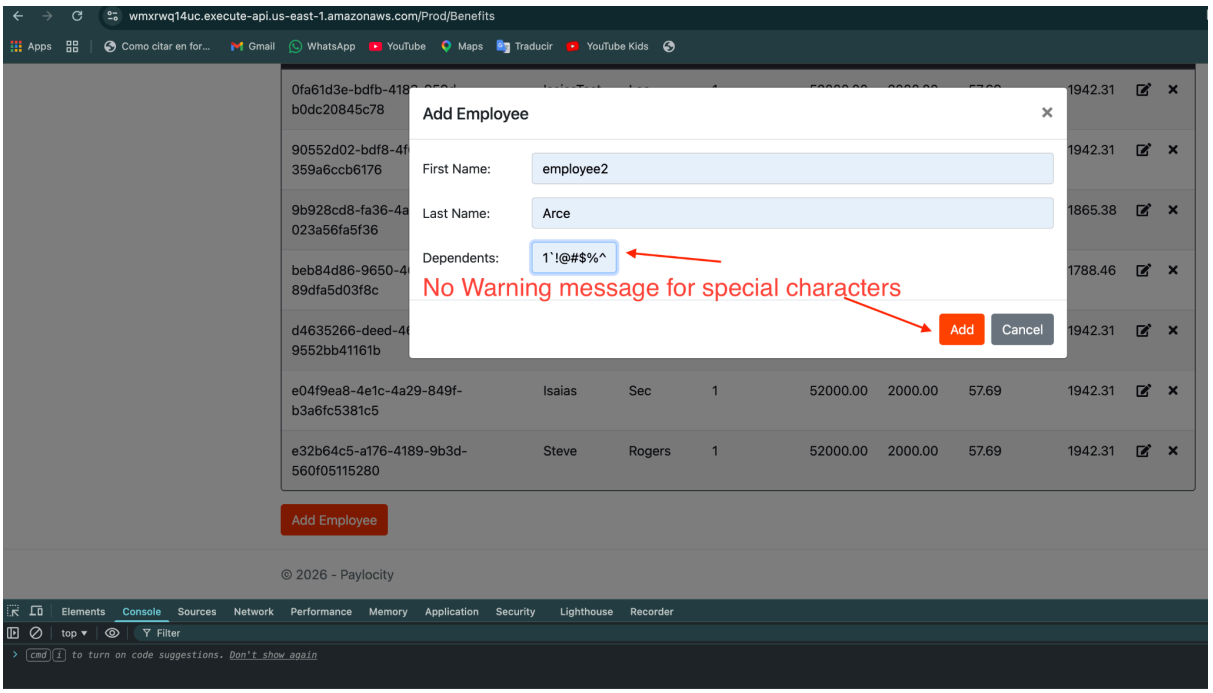
• **Description:** The "Dependents" input field does not restrict keystrokes to numeric values only. A user can type a mixture of numbers and special characters (e.g., 1'!@#$%^). Instead of rejecting the invalid input and displaying a validation error, the application silently parses out the numeric value, strips the special characters, and saves the record without notifying the user that their input was modified.

• **Steps to Reproduce:**

1. Log in to the application and navigate to the Benefits Dashboard.
2. Click the "Add Employee" (or Edit) button.
3. In the Dependents field, enter a number followed by special characters (e.g., 1'!@#$%^).
4. Fill out the remaining required fields and click "Add/Update".

• **Expected Result:** The input field should strictly prevent the entry of non-numeric characters (e.g., using <input type="number">). If invalid characters are pasted, the UI should block the submission and display a warning message such as "Dependents must be a whole number."

• **Actual Result:** The field accepts the special characters, no warning is displayed, and the system silently saves the record using only the parsed integer.
• **Evidence:**



BUG-UI-016: Rapid multiple clicks on the "Add" button create duplicate records
• **Severity:** Medium
• **Description:** The "Add" button in the employee modal does not disable itself or employ a debounce mechanism upon being clicked. If a user double-clicks or rapidly multi-clicks the button, the frontend dispatches multiple concurrent POST requests to the API. This results in duplicate employee records being created and saved to the database (each assigned a different UUID).
• **Steps to Reproduce:**
1. Log in to the application and navigate to the Benefits Dashboard.
2. Click the "Add Employee" button.
3. Enter valid data into the First Name, Last Name, and Dependents fields.
4. Rapidly double-click or multi-click the "Add" button before the modal closes.

• **Expected Result:** Upon the first click, the "Add" button should immediately become disabled (and ideally show a loading indicator) to prevent subsequent submissions while the API request is processing. Only one record should be created.
• **Actual Result:** The button remains active, multiple API requests are fired off, and identical duplicate records appear in the data table.

• **Evidence:**

wmxrwq14uc.execute-api.us-east-1.amazonaws.com/Prod/Benefits
